EXPERIMENT 9

Name: Pranav Shanmugam
Roll No: 240701395

AIM

To simulate the different stages involved in UI design using the Rapid Application Development (RAD) model and develop a simple interactive interface using Axure RP.

RAD Lifecycle Phases

- **Requirement Planning:**
  In this phase, the basic idea of the application is identified along with user needs such as login, registration, and order flow.
- **User Design:**
  The interface screens are designed to represent how the user will interact with the system.
- **Construction:**
  The prototype is built by adding UI components and linking screens using interactions.
- **Cutover:**
  The final prototype is tested and presented to simulate real-time usage.

Screens in the Prototype

Splash Screen

- This screen acts as the initial interface when the application is launched.
- It presents the logo of the game store along with a short tagline such as *"Pay less, play more"* to attract users.
- It helps in creating a visual identity and gives users a quick understanding of the app's purpose.
- No user interaction is required on this screen, as it functions only as a loading or welcome page.
- The screen automatically transitions to the sign-in page after a short duration.

Sign In Screen

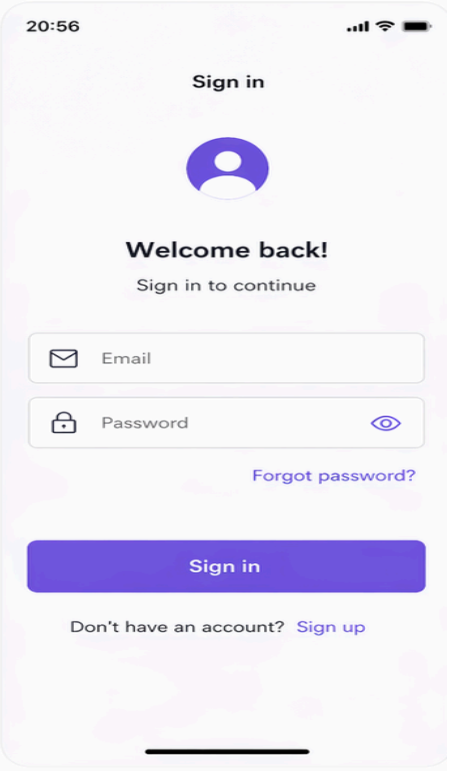
- This screen is designed for existing users to access their accounts.
- It contains input fields such as email and password for authentication.
- A login button is provided to proceed after entering valid details.
- Additional options like “Forgot Password” and “Sign Up” are included for user convenience.
- The buttons are interactive and simulate navigation between screens in the prototype.
- This screen ensures a simple and user-friendly login experience.

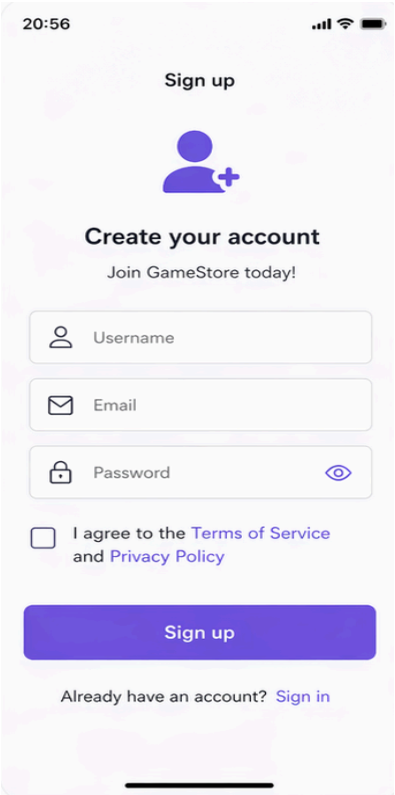
Sign Up Screen

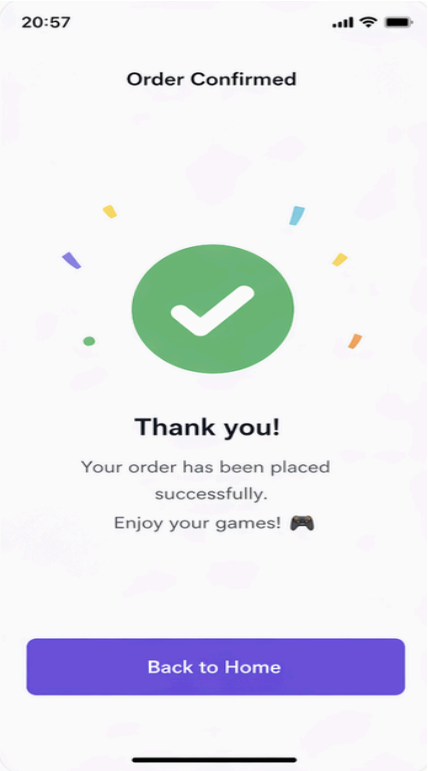
- This screen allows new users to register and create an account.
- It includes input fields such as username, email address, and password.
- A confirmation password field may also be included to ensure accuracy.
- It demonstrates the onboarding process for first-time users of the application.
- Since this is a prototype, the entered data is not stored or processed.
- The main purpose is to visualize how user registration would work in a real application.

Order Confirmation Screen

- This screen appears after a user successfully completes an action such as purchasing or selecting a game.
- It displays a confirmation message indicating that the order has been placed successfully.
- A visual element like a checkmark icon is used to clearly indicate success.
- It may include a short summary or message to reassure the user.
- A button such as “Back to Home” or “Continue” can be provided for further navigation.
- This screen enhances user satisfaction by providing clear feedback about the completed process.







Conclusion

This experiment demonstrates how the RAD model can be applied to quickly design and test user interfaces. The use of Axure RP made it easier to visualize the application flow and understand the importance of interactive design without full implementation.
